

YOKOBU

A text interface for Korean business conversations

For expats, tourists, and deaf or hard-of-hearing users in Korea who need information or help.

Language and accessibility barriers can prevent people from getting the information they need by phone.

The customer experience

01 **Describe a need**

English by default, with Russian and Chinese options.

02 **Clarify through chat**

OpenAI generates the interview and a concrete call plan.

03 **Review and authorize**

Choose a fictional institution, then explicitly say Yes.

04 **Resolve questions in Korean**

Realtime voice speaks to the teammate. Unknown details return to chat.

05 **Receive the result**

A conversation-grounded summary and a reasoned recommendation.

The laptop demonstration

Planned acceptance run using real OpenAI services

CUSTOMER TAB

“I want to go to a hospital.”

Answer the AI’s questions.
Review the plan and authorize.
Reply to unknown details in chat.

BUSINESS TAB

**Inactive until authorized
and accepted**

The teammate accepts the call.
Speak Korean through the laptop’s
microphone and speaker.

The teammate asks a detail the interview has not covered.
The AI asks the customer, waits, and relays the answer in Korean.

Completion requires every required answer and a confirmed readback.

What is verified

Customer interface and Codex checks

20 synthetic browser checks passed across English, Russian, and Chinese.

Checks use mocked API responses. They do not verify real AI or speech.

Live OpenAI conversation

Blocked: the configured API account has no credit (HTTP 429).

Korean microphone and audible Realtime speech

Unverified: no completed live microphone and speaker run.

Codex built call-state rules and UI checks. We tested connection loss, unknown-detail relay, and incomplete endings against explicit expectations.

Value hypothesis and scope

Can a text conversation reduce the barrier to getting help from a Korean business?

User value: Unverified

No feedback from actual target users has been collected.

Today's scope

Fictional institutions. Simulated calls in two laptop tabs.
No real calls, real discovery, or reception/doctor sheets.
